A shift to the new norm: riding the wave of change

Shifts to the new abnormal: riding the waves of climate change

Roger Jones and Jim Ricketts
Victorian University Melbourne

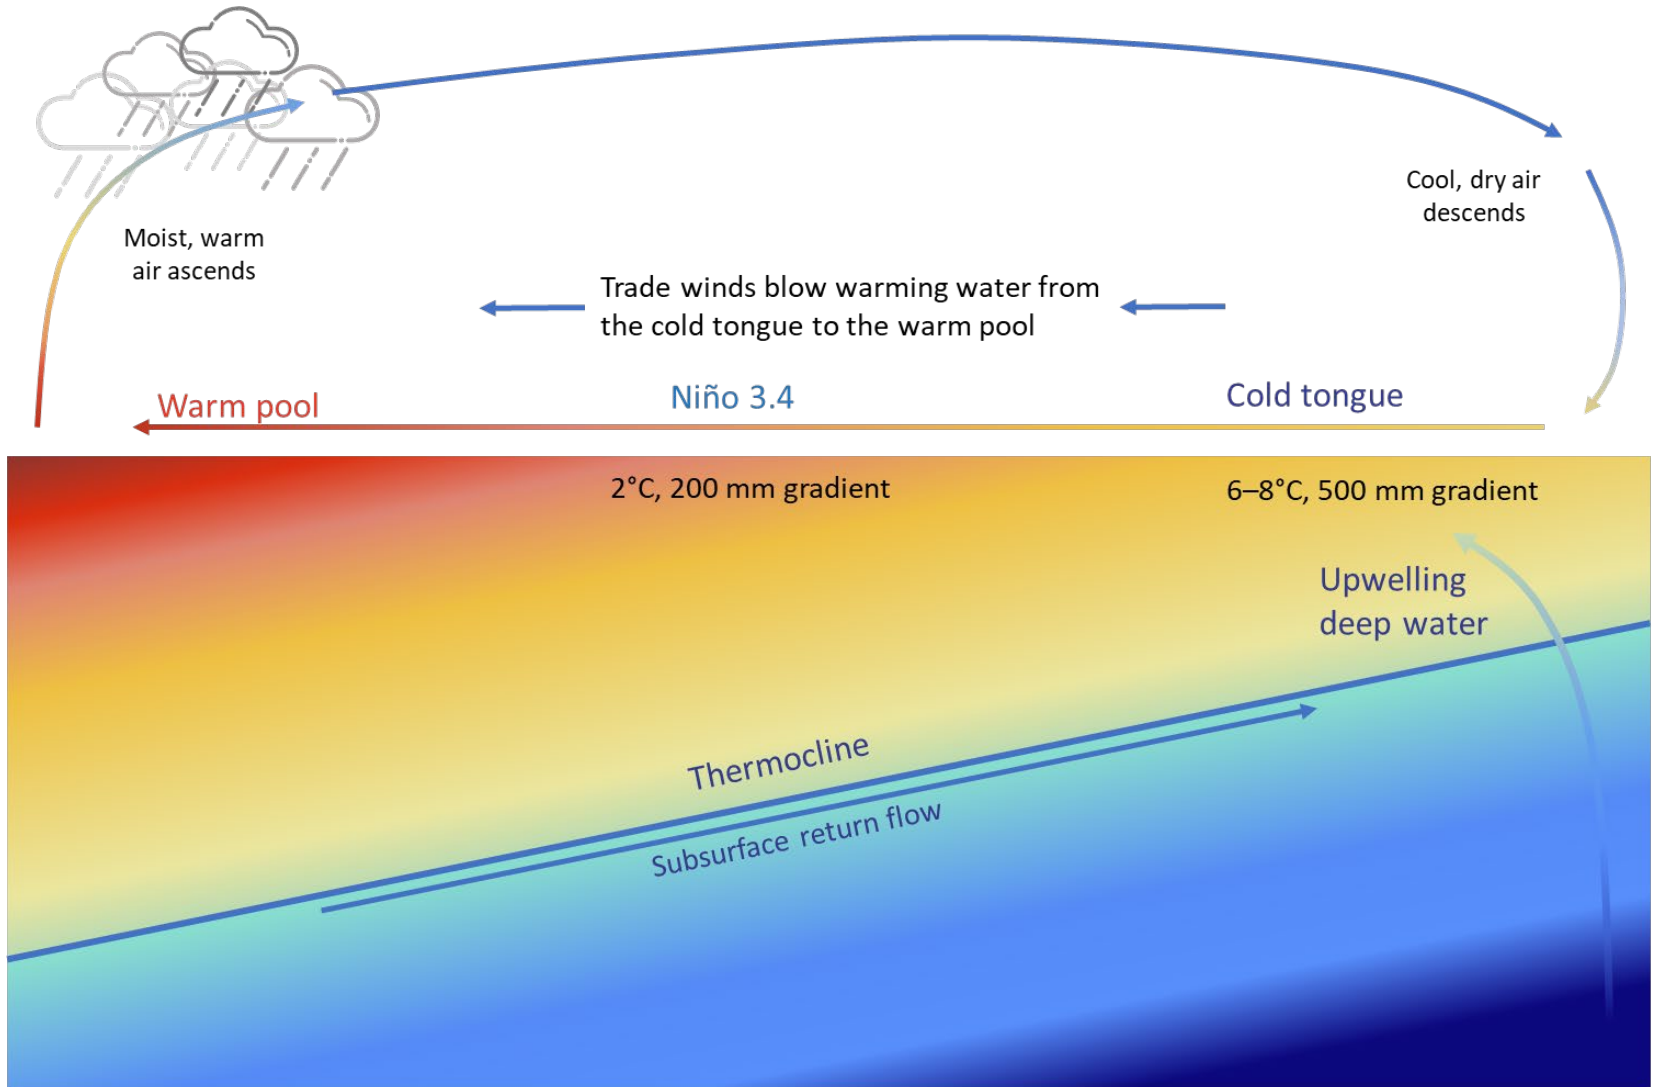

Shifts to the new abnormal

1. Climate forms a series of regimes, where steady-state conditions are separated by abrupt regime changes
2. Climate change and variability are not separate processes, all energy follows the same pathway.
3. Warming follows a step-ladder like pattern – as a series of shifts to higher energy (warmer) states, separated by periods of relative stability.
4. These are shifts to a new ‘abnormal’ state of heightened risk.
5. To ride the waves of change, we have to understand them

Climate as a series of heat engines

Pacific Ocean heat engine

How it works

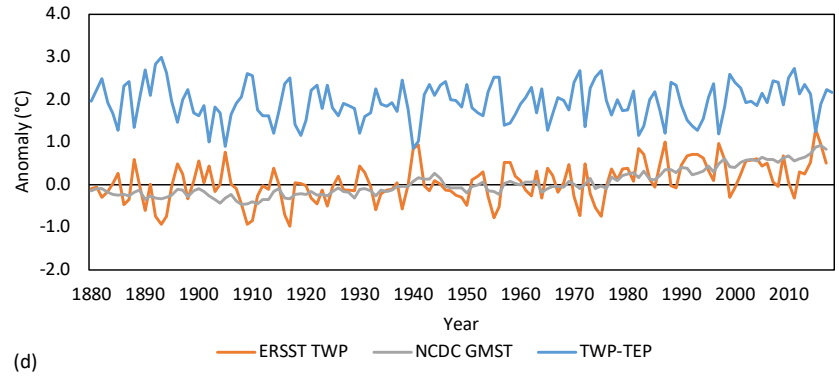

East-central Pacific

Global mean surface temperature

Western Pacific warm pool

Warm pool, GMST & east-west difference

Key dates

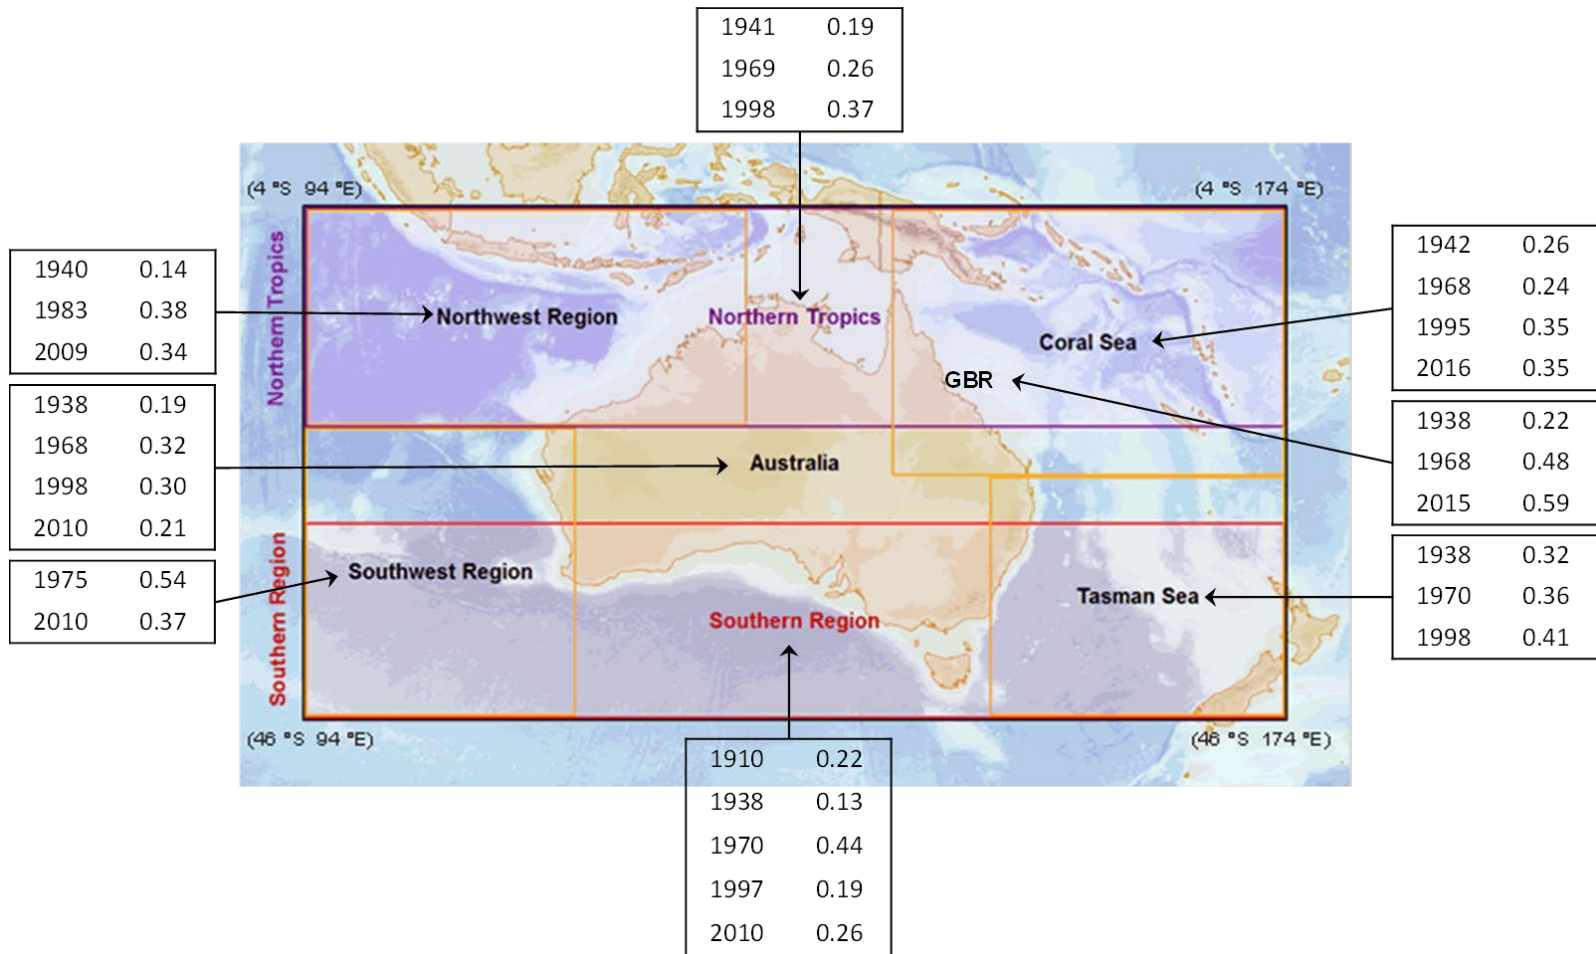

- 1901–03 abrupt ocean cooling
- 1920–21 NH warming, land dominated
- 1925–26 NH warming ocean-dominated
- 1937–38 Ocean warming global
- 1968–69 Warm pool and SH
- 1976–79 Pacific shift, SH then NH
- 1986–89 NH some ocean, mainly land
- 1995–98 Pacific-Atlantic lock then shift, warm pool, SH then NH
- 2010 Minor shift SH
- 2012–15 Warm pool, some SH mainly NH

Heat engine in
forced mode

Shifts in sea surface temperatures

Shifts in Australian regional temperature

Observed shifts

National average change

Maximum temperature

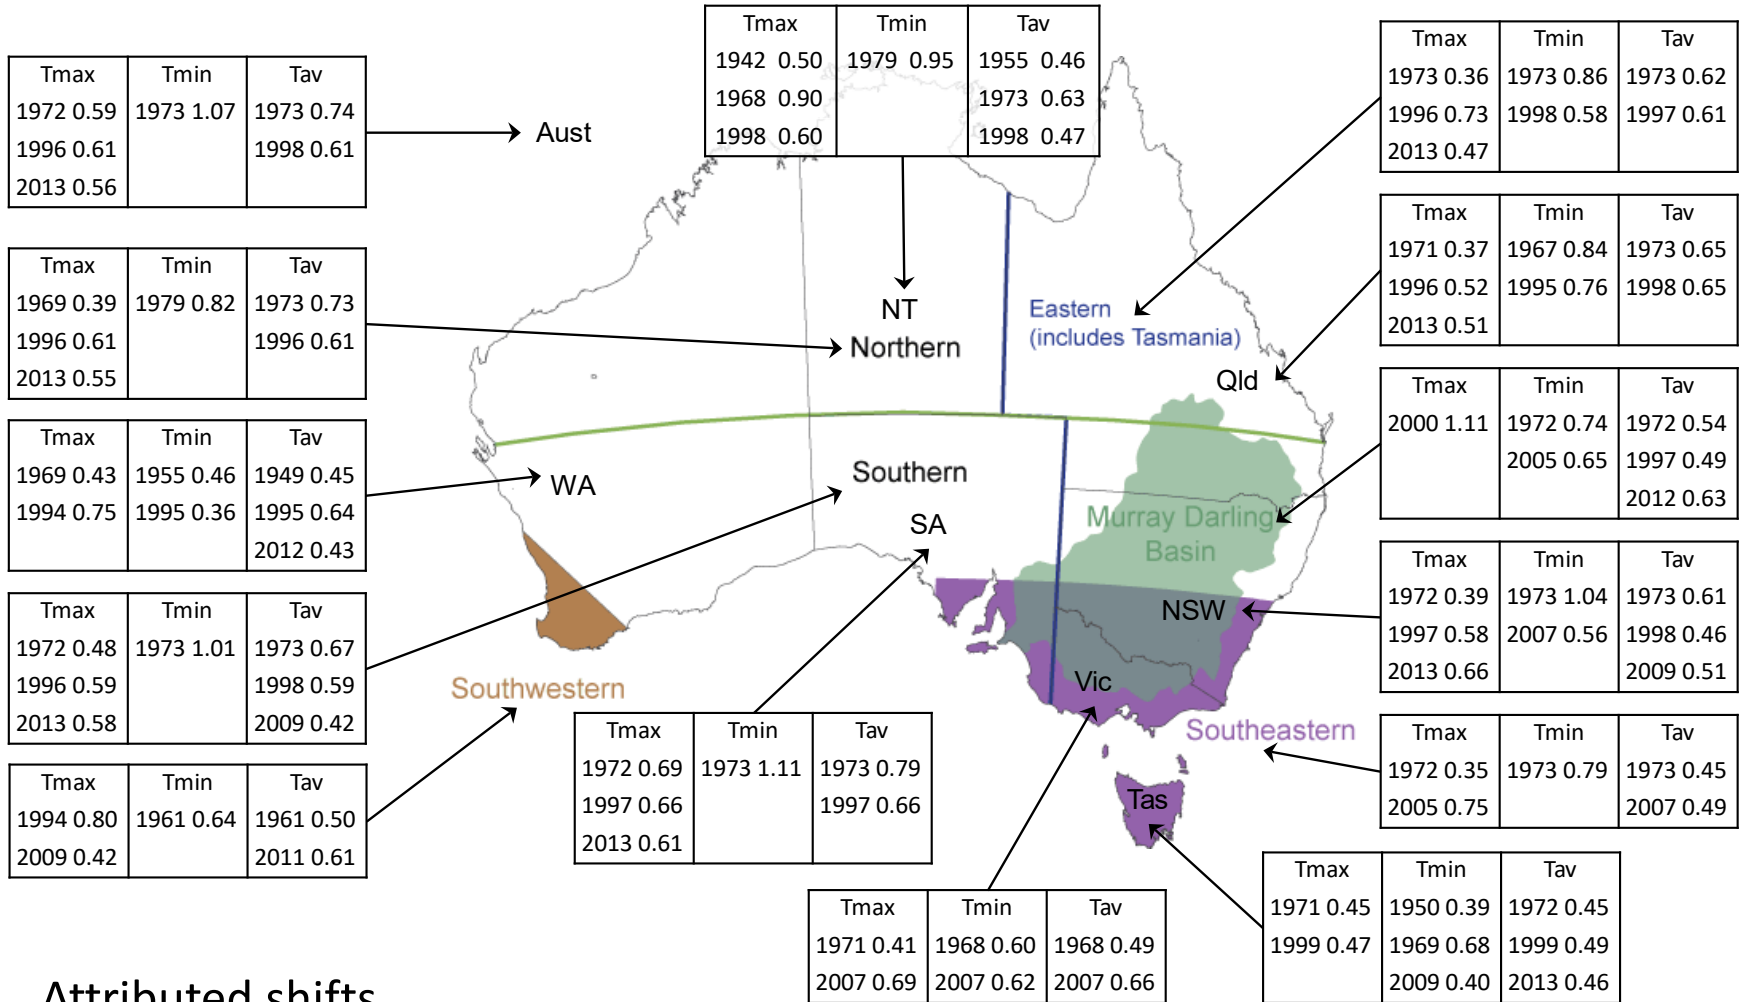

Minimum temperature

Average temperature

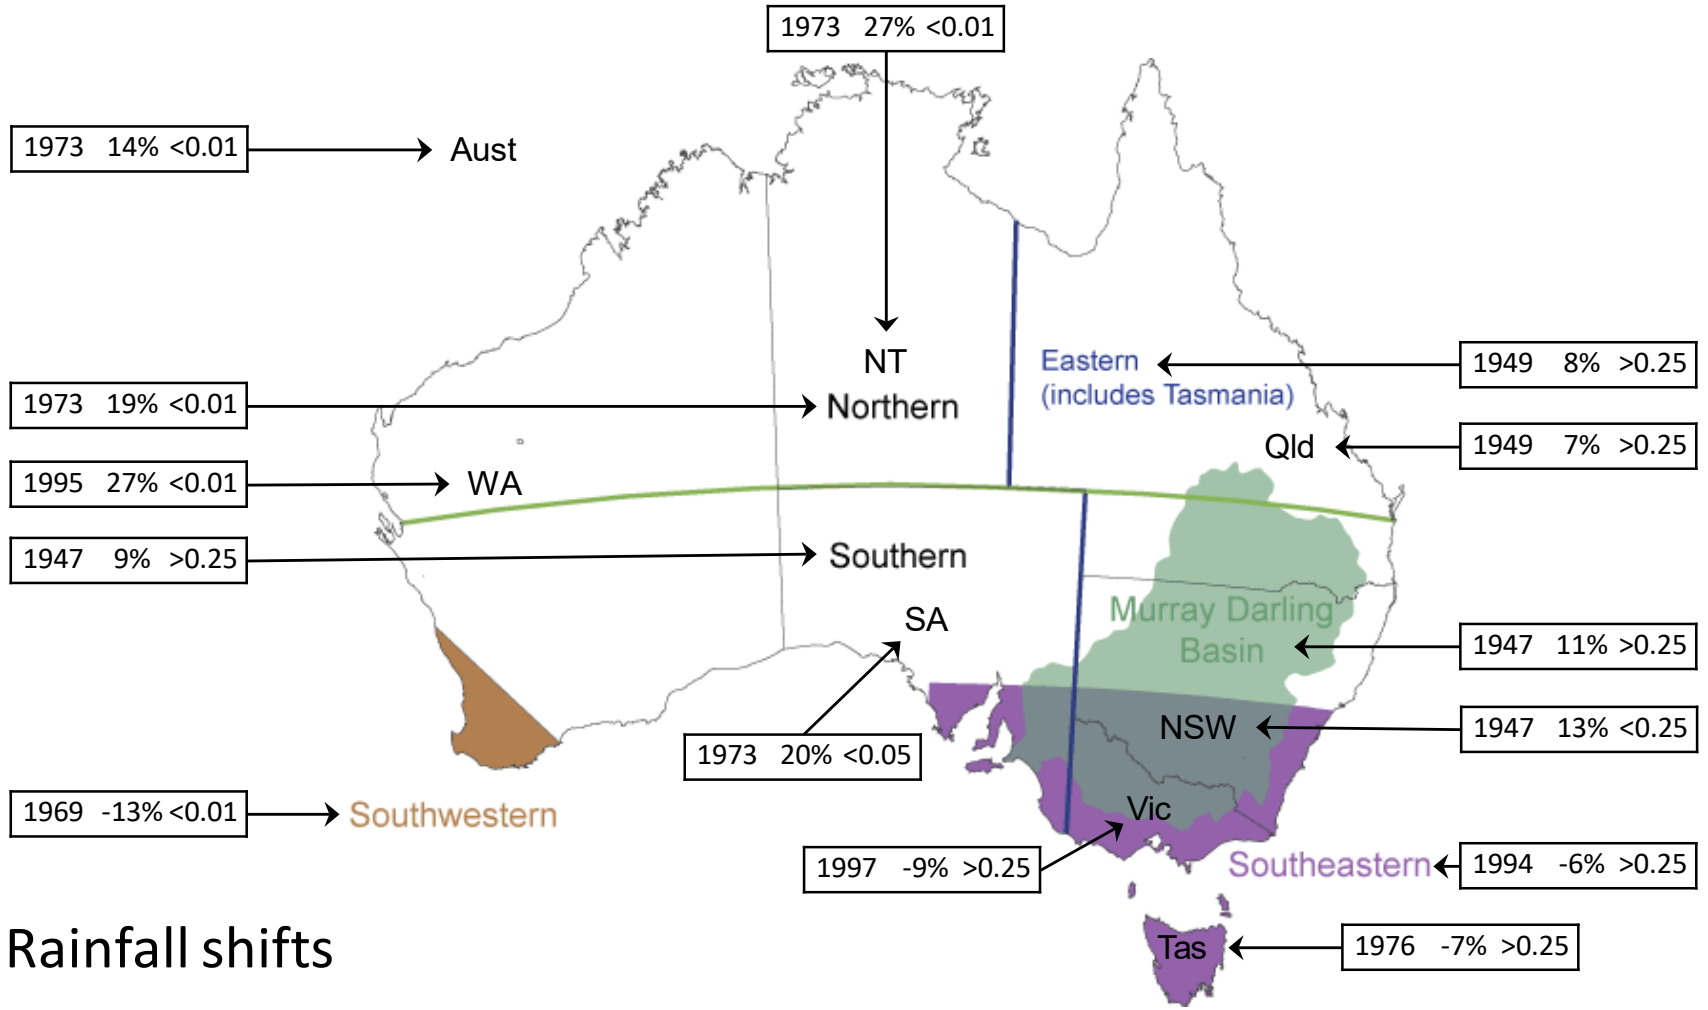

Shifts attributed to greenhouse gas forcing

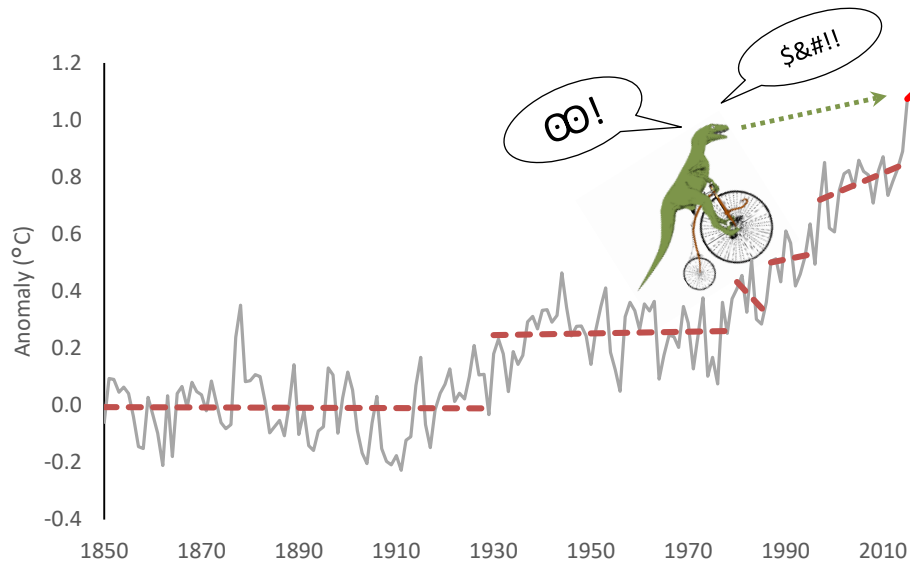

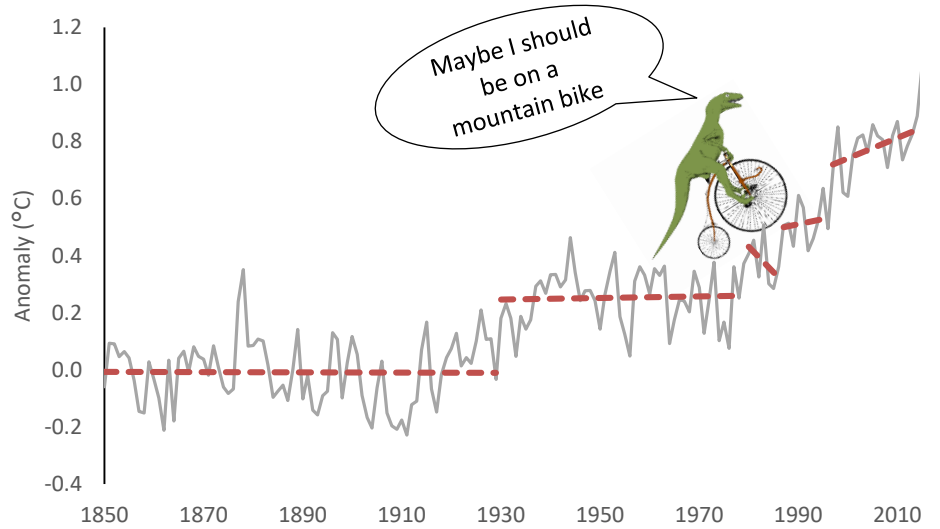

Attributed shifts

Shifts in rainfall

Rainfall shifts

Why does it matter? Ask the adaptoraptor

Very high FFDI or greater – 9 Vic sites

Conclusions

- Climate change is driven by a network of heat engines, governed by the one in the tropical Pacific Ocean.
- When they need to move more heat to the top of the atmosphere and the poles, they will shift to a new steady-state
- Australia is just to the south of the heat engine, so is in the first line of a shifting climate
- We need to explore what this means for the future planning and delivery of emergency services

We need to
plan smarter

Don't let the
adaptoraptor
go extinct
again
